

Interaction flow

1. **Reserve a QoS profile / slice for the camera uplink**
   Network App → Exposure (QoS on Demand)
2. **Stream live video to the inference server**
   Roadside Camera → gNB · 5G Core → Inference Server
3. **Monitor network KPIs and adapt QoS**
   Network App ⇄ Exposure (QoS/KPI Monitoring)
4. **Report a detected collision**
   Inference Server → Emergency alerts (within Network App)
5. **Identify UEs within the collision area**
   Network App → Exposure (Location & Geofencing)
6. **Alert affected vehicles and pedestrians**
   Exposure (Device Notification) → Vehicle & Pedestrian UEs
